

A dark gray magnifying glass is centered on the page. The lens is a large circle, and the handle is a thick line extending from the bottom left towards the center of the lens. Inside the lens, the words "Artificial" and "Intelligence" are written in a dark gray, monospaced font, stacked vertically and centered.

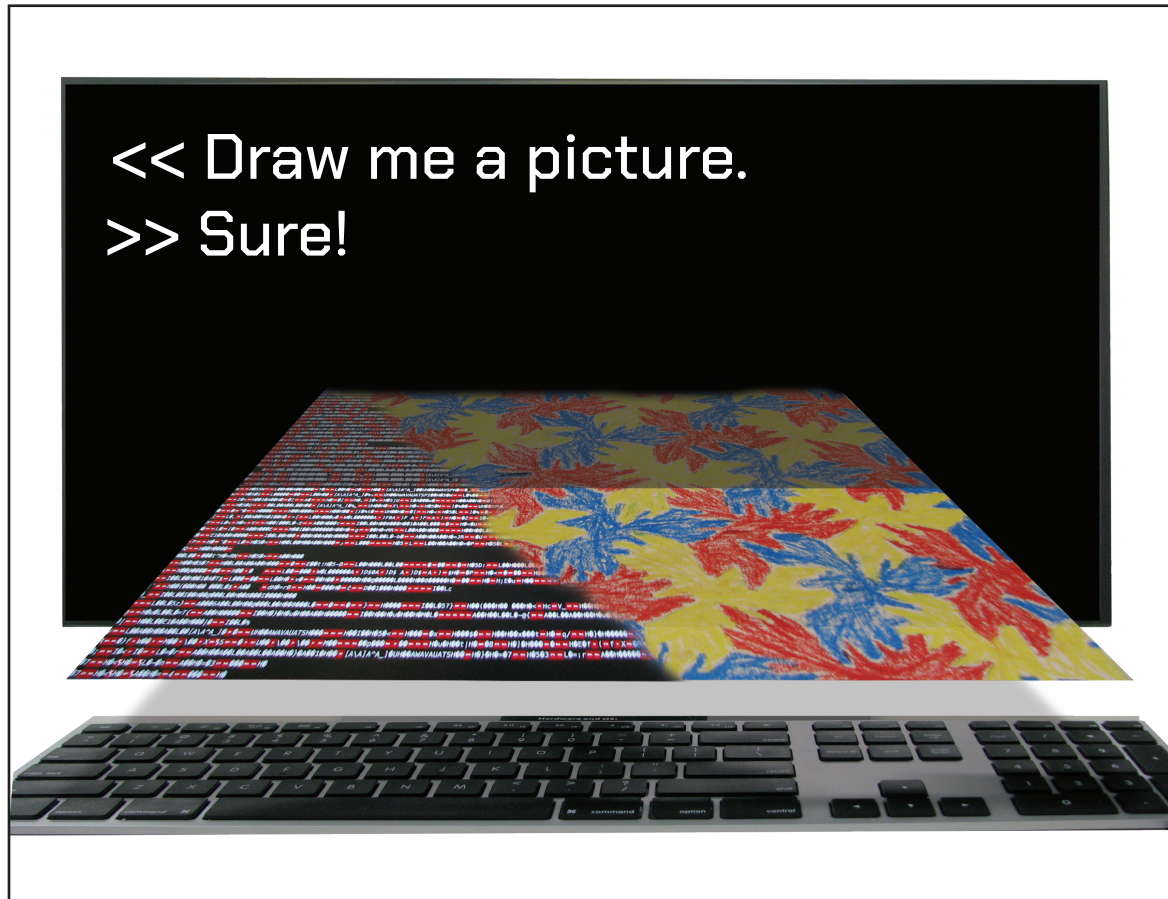

Artificial
Intelligence

Can

be
creative?

AI can exhibit creativity.

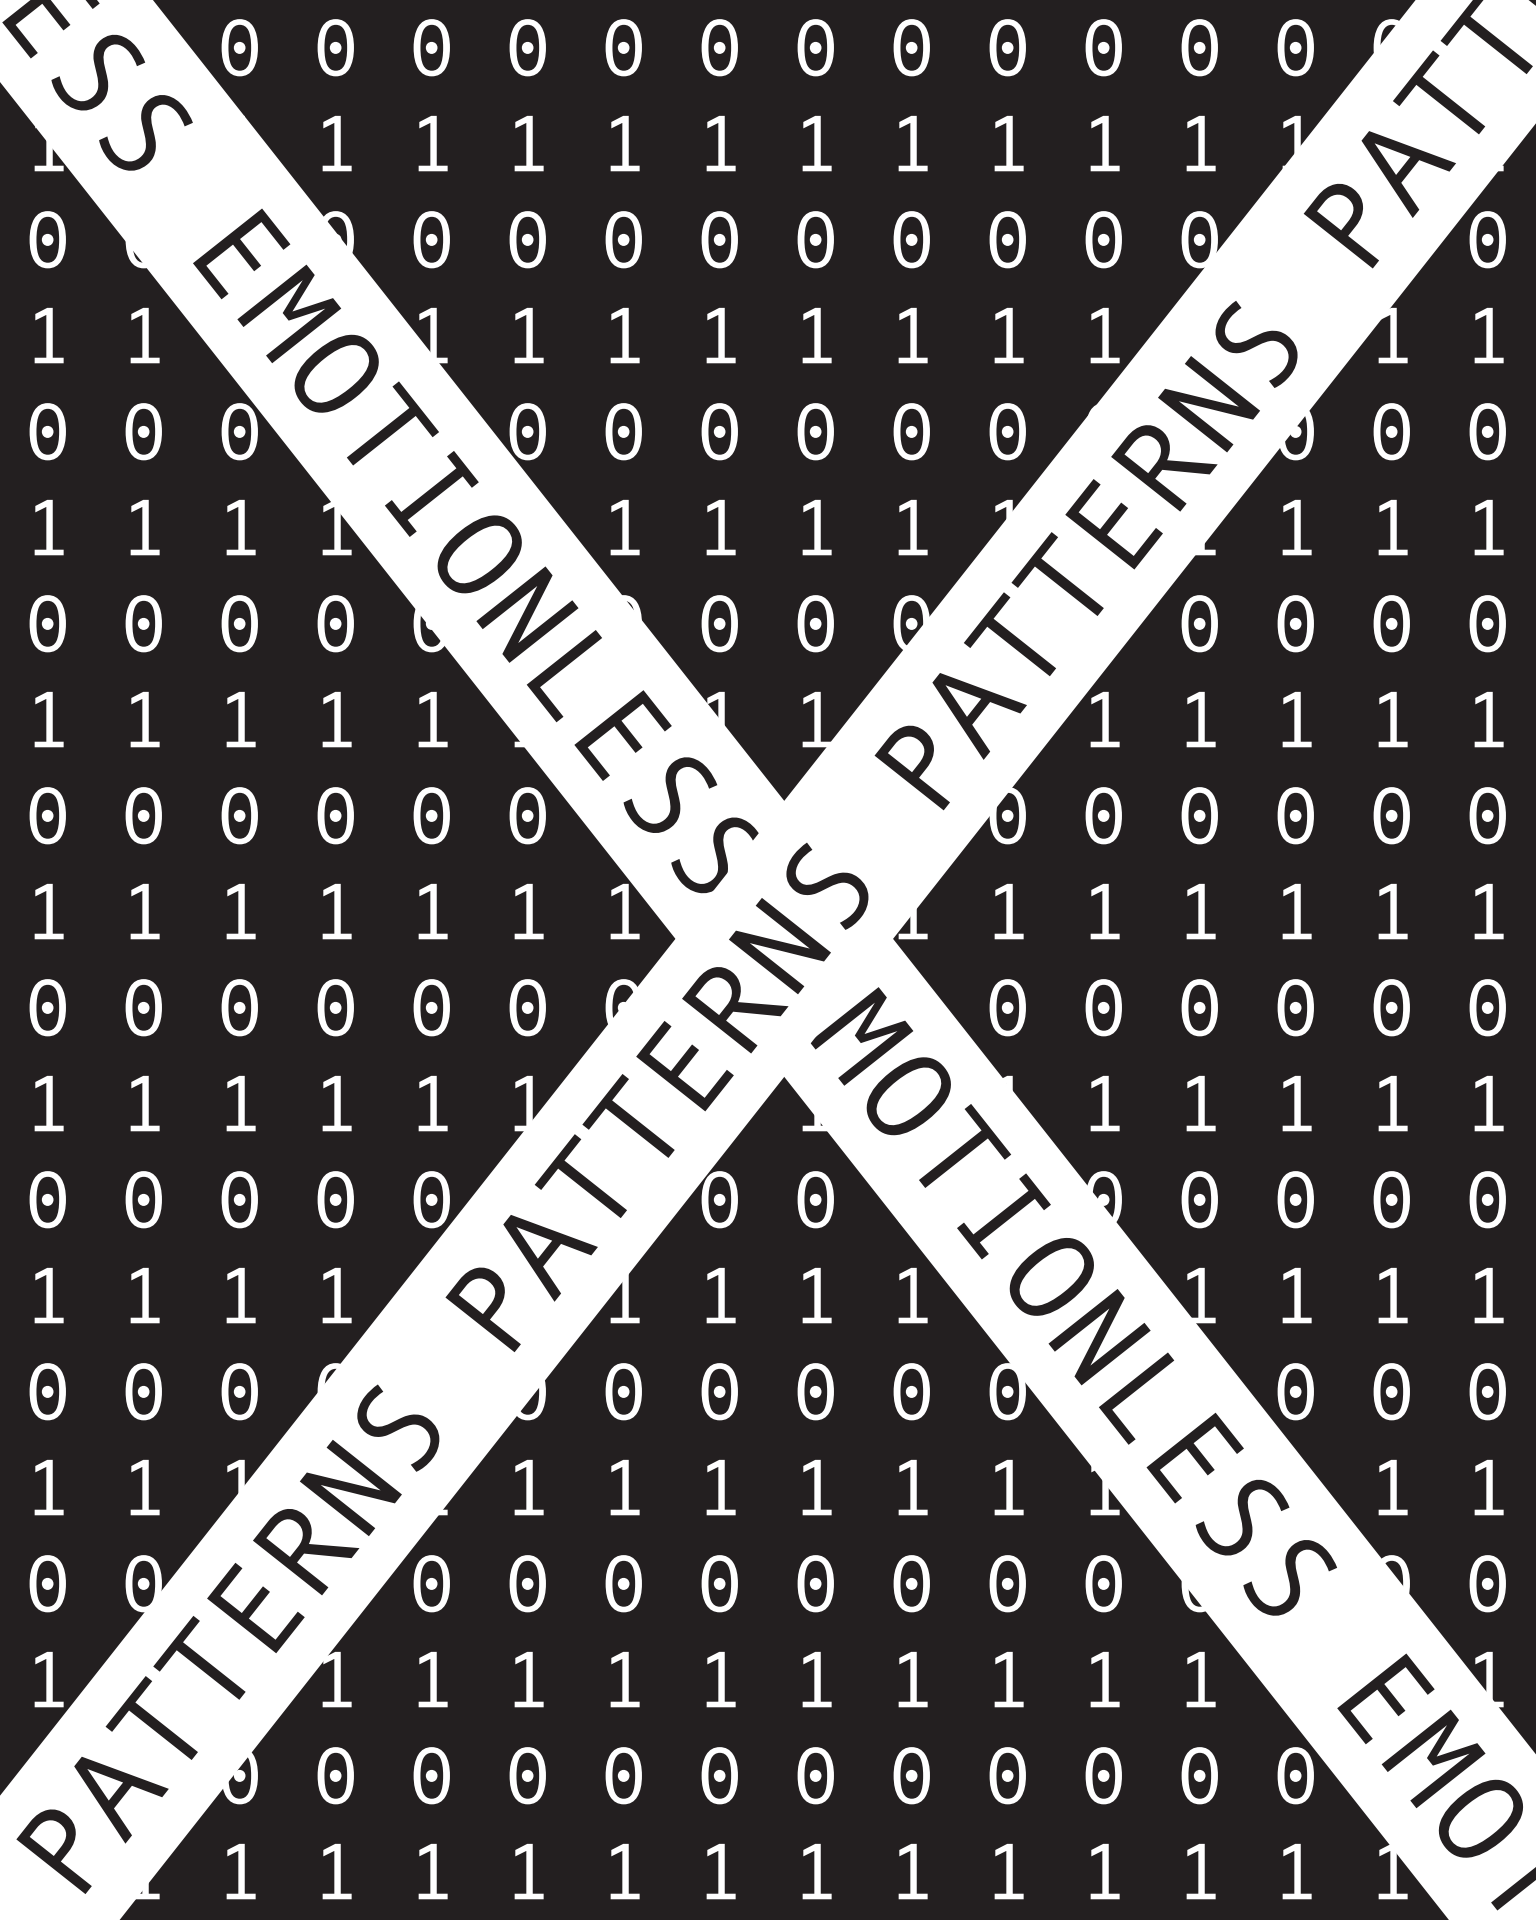

It's capable of generating novel and diverse outputs. AI can generate text, create art, compose music, and even come up with innovative ideas

However, **AI** creativity is a result of statistical patterns learned from vast amounts of **data**, and it doesn't involve personal **experiences, emotions,** or subjective interpretation in the same way humans do.

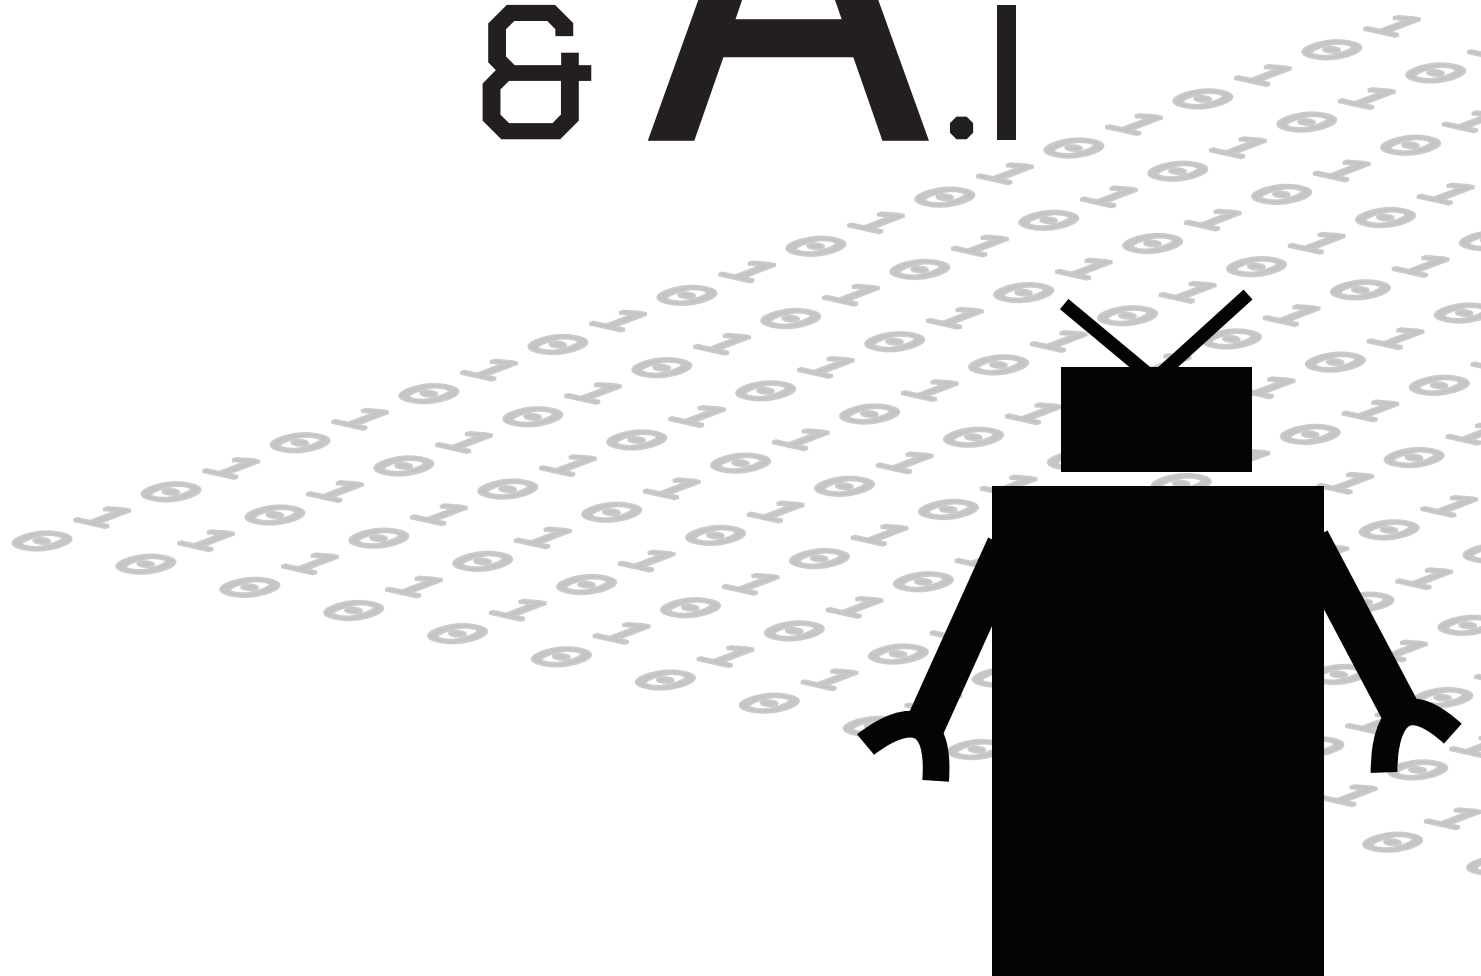

The outputs can appear novel and innovative, **but it lacks** true consciousness, emotion, and a deep understanding of **context**

HUMAN & A.I.
